2023-09-13

`stmtext` is a wrapper documentclass around a selection of existing class layouts for L^AT_EX. Additionally, it allows quick access to the modules of `stmlatex`.

2.	String class options	4
3.	Additional string class options for <code>layout=dlr</code>	4

1. About

`stmdtext` is supposed to be an easy-to-use interface to several other document classes with the additional use of the modules of `stmdlatex`. The class addresses users who want to use certain features without initially worrying about their implementation. However, there will most certainly come a point in the learning curve of a \LaTeX user where this documentclass becomes insufficient. That's what's wanted. Maybe, until this point, the class has helped to bring some possibilities of \LaTeX closer.

The goal is to make \LaTeX functionalities available to the user. It is not intended to make any changes to the document layout, despite loading the underlying document classes. The rest of the layout can be freely changed by the user.

The complete class and module system can be found at

<https://github.com/raedma/stmdlatex>

2. Options

This section describes the class options. All options are key-value-options, meaning they are set using the definition `KEY=VALUE`. It must be noted that these options can not represent the full features of the module packages. In case more advanced options are required make sure to have a look at the individual package descriptions and consider loading them individually. Maybe you find what you need.

2.1. Overview

This overview contains the most important informations about package options. If there are additional comments about individual options an additional section is created for their description.

Boolean options These options can only have the values `true` or `false`.

Table 1: Boolean class options

Key	Default value	Description
<code>attachfile</code>	<code>false</code>	Load the <code>attachfile</code> package at the correct position relative to <code>stmdhyperref</code>
<code>bibliography</code>	<code>false</code>	Load the <code>bibliography</code> package
<code>calc</code>	<code>false</code>	Load the <code>calc</code> package at the correct position relative to <code>stmdtikz</code>
<code>cleverref</code>	<code>false</code>	Load the <code>cleverref</code> package at the correct position relative to <code>stmdhyperref</code>
<code>color</code>	<code>true</code>	Load the <code>stmdcolors</code> package

continued ...

...continued

Key	Default value	Description
<code>conditionallox</code>	<code>true</code>	Load the stmconditionallox package
<code>conditionalloxnewpage</code>	<code>true</code>	Set the value of the <code>newpage</code> option in the <code>stmconditionallox</code> package
<code>date</code>	<code>false</code>	Load the stmdate package
<code>glossaries</code>	<code>false</code>	Load the stm glossaries package
<code>index</code>	<code>false</code>	Load the stmindex package
<code>hyperref</code>	<code>true</code>	Load the stmhyperref package
<code>listings</code>	<code>false</code>	Load the stm listings package
<code>math</code>	<code>false</code>	Load the stm math package
<code>plots</code>	<code>false</code>	Load the stm plots package
<code>tabular</code>	<code>false</code>	Load the stm tabular package
<code>tikz</code>	<code>false</code>	Load the stm tikz package
<code>units</code>	<code>false</code>	Load the stm units package

String options These options have strings as values. Possible arguments are listed. The default is underlined.

Table 2: String class options

Key	Values	Description
<code>language</code>	<code>german <u>english</u></code>	Document language, Load the <code>stm language</code> package with this option
<code>layout</code>	<code>standard dlr <u>koma</u></code>	Document layout
<code>type</code>	<code>article <u>report</u> book</code>	Base document type

The following options are only available for `layout=dlr` which uses the RM-LaTeX based document classes.

Table 3: Additional string class options for `layout=dlr`

Key	Values	Description
<code>institute</code>	<u>FA-STM</u>	See the RM-LaTeX documentation for alternatives
<code>site</code>	<u>BS</u>	See the RM-LaTeX documentation for alternatives

2.2. Option attachfile

The package [attachfile](#) is one of the packages that has to be loaded at a specific relative position to [hyperref](#). Thus, this option is only relevant in case the Option `hyperref`

from section 2.7 is used.

2.3. Option `cleveref`

The package `cleveref` is one of the packages that has to be loaded at a specific relative position to `hyperref`. Thus, this option is only relevant in case the Option `hyperref` from section 2.7 is used.

2.4. Option `conditionallox`

In case the option `conditionallox` is used, the document has to be compiled at least three times.

2.5. Option `glossaries`

Setting `glossaries=true` loads the `stmglossaries`. Thus, the user is able to use the glossary entries from the package as described in the package documentation.

In case the `arara` package is used for the build automation of the \LaTeX document, add

```
arara: makeglossaries
```

in the build automation part of your preamble. That way, the glossaries are automatically compiled during your document creation.

For the glossaries to show up in your document, simply place the commands to print the glossary entries of your choice at the location in your document where you want them to show up, e.g.

```
\printstmacronyms  
  
\printstmscalarglossary  
\printstmvectorglossary  
\printstmmatrixglossary  
\printstmstateglossary  
\printstmindexglossary  
\printstmexponentglossary  
\printstmoperatorglossary
```

or

```
\printstmacronyms  
\printallstmsymbols
```

In case no entries are defined, the lists are simply omitted in your document.

2.6. Option index

2.6.1. Base package issues

There are issues with the `nonewpage` option of the base package. Thus, currently, there is no chance to disable that an index is created on a new page.

2.6.2. Individual indices

In case it is desired to use other than the default index settings, e.g. create a new index next or replacing the standard, it is recommended to load `stmttext` with the option `index=false` and loading the index individually. Otherwise, there might be conflicts in case `tikz=true` is used in combination.

```
\documentclass[%  
  ...  
  index=false,%  
  ...  
{stmttext}  
  
...  
  
% replace standard index  
\usepackage[  
  standard=false  
{stminindex}  
  
...  
  
% Must come after \makeindex, e.g. from stminindex  
\usepackage{stmtikzexternalization}
```

2.7. Option hyperref

<https://tex.stackexchange.com/a/26592>

2.8. Option layout

This class is supposed to be an interface between different class bundles. Currently, this class offers an interface to the standard L^AT_EX class bundle (`article`, `report`, `book`), the KOMA-script bundle (`scrartcl`, `scrreprt`, `scrbook`) and the RM-L^AT_EX bundle.

It is not the goal to implement all options of all classes rather than to allow an easy switch for standard documents. In case you miss an option for a specific bundle, feel free to implement it.

2.9. Other options

All other options not explicitly list in section 2.1 are passed to the underlying document class. Thus, it has to be made sure that the underlying document class understands these options. At this point, switching the argument in the `Option layout` may lead to problems in case the options is specific to a document class.

3. Usage

3.1. type-independent document structure
