## Martin Rädel

## 2023-08-01

For larger documents, such as reports and thesis, it is nice to have LATEX take care of things like a list of acronyms or symbols.

If you write multiple documents you maybe want to make sure that the acronyms and symbols you use throughout all your texts are consistent. And you maybe also want to have the chance to change a symbol at a single location instead of crawling through every equation that might be affected by a change in notation.

This package provides an expendable set of commonly used acronyms as well as symbols in structural mechanics. It is build upon the glossaries package.

## **Contents**

| Lis | st of Tables   | 3           |
|-----|--|-------------|
| 1.  | Example  | 3           |
| 2.  | Requirements   | 3           |

# 1. Example

This is a simple test. It uses an acronym auxiliary power unit (APU). You can use all the acronyms defined in Appendix A. The example also has an equation to test the symbols:

$$F = ma (1)$$

It creates a nice little list of symbols

# **Scalars**

| Symbol | Name         | Description |
|--------|--------------|-------------|
| a      | Acceleration |             |
| m      | Mass         |             |
| F      | Force        |             |

# 2. Requirements

Perl is required to use the arara makeglossaries rule. Either install Perl or include a path to a binary to the system PATH variable. E.g. a Perl binary is shipped with Git under GITINSTALLPATH\usr\bin\.

# 3. Contents

There are multiple packages included:

Table 1: Package description

| Package                       | Description                                     |
|-------------------------------|---|
| stmglossaries                 | Wrapper around the definitions for acronyms and |
|                               | symbols with options to load both               |
| stmglossariesbase             | Loads the underlying base package               |
| stmglossariesacronyms         | Main package for acronyms                       |
| stmglossariesacronymscommands | Acronym utility and shortcut commands           |
| stmglossariesacronymsitems    | Acronym definitions                             |
| stmglossariesacronymsstyles   | Styles for printing acronym lists               |
| stmglossariesglossary         | Main package for glossary                       |
| stmglossariesglossarycommands | Glossary utility and shortcut commands          |
| stmglossariesglossaryitems    | Glossary entry definitions                      |
| stmglossariesglossarystyles   | Styles for printing glossary lists              |
| stmglossariessymbols          | Main package for symbols                        |
| stmglossariessymbolscommands  | Utility commands for symbols                    |
| stmglossariessymbolsitems     | Symbol definitions                              |
| stmglossariessymbolsstyles    | Styles for printing symbol lists                |

#### 3.1. Acronyms

stmglossariesacronyms.sty is the control package for acronyms. It can be used to control the acronym package modules.

stmglossariesacronymsitems.sty contains all acronym definitions. These can be used by the \gls-like commands of glossaries, see section 6.1 of the glossaries documentation.

stmglossariesacronymsstyles.sty contains implementations for the style option in a call to \printglossary[type=\acronymtype,style=STYLENAME]. See subsection 6.1 for details.

# 3.2. Glossary

stmglossariesglossary.sty is the control package for the glossary. It can be used to control the glossary package modules.

stmglossariesglossaryitems.sty contains all acronym definitions. These can be used by the \gls-like commands of glossaries, see section 6.1 of the glossaries documentation.

stmglossariesglossarystyles.sty contains implementations for the style option in a call to \printglossary[type=main,style=STYLENAME]. See subsection 6.2 for details.

#### 3.3. Symbols

stmglossariessymbols.sty is the control package for symbols. It can be used to control the symbol package modules.

stmglossariessymbolsitems.sty contains all symbol definitions. These can be used by the \glssymbol command of glossaries, see section 6.2 of the glossaries documentation.

stmglossariessymbolsstyles.sty contains implementations for the style option in a call to \printglossary[type=scalarlist,style=STYLENAME]. See subsection 6.3 for details.

stmglossariessymbolscommands.sty contains utility commands to facilitate the use of symbols and operators.

# 4. Usage - in the preamble

There are different options to load acronyms, symbols or the whole thing. Additionally, the package offers some predefined styles to set your symbols in a nice way.

### 4.1. Base package

stmglossariesbase loads the underlying base package. It must not be loaded explicitly by the user. All other packages check if the package was already loaded with

\usepackage{stmglossariesbase}

In case you or another package have not loaded *stmglossariesbase* with own options beforehand, the package will load the underlying base package with the options acronym, nomain and toc.

#### 4.1.1 Change titles

There are different possibilities to change the displayed title for the individual \printglossary calls. Especially in case the acronyms and glossary packages are used in combination, the from glossaries documentation, please use

```
\renewcommand*{\acronymname}{...}
\renewcommand*{\glossaryname}{...}%
\renewcommand*{\symbolname}{...}%
instead of changing the title locally with
\printglossary[...,title={...}]
```

as the latter does not affect the name in references.

#### 4.2. Load the whole package - acronyms, glossary and symbols

This way, the acronyms, glossary as well as the symbol items are loaded. Load the package by adding

\usepackage{stmglossaries}

to your preamble.

#### 4.2.1 Options

**Option** acronyms This is a boolean option. Expected values are either true or false. It controls whether to load the acronym definitions.

\usepackage[acronyms=true]{stmglossaries}

acronyms=true is the default and loads the acronyms. It is used in case acronyms=false is not set explicitly.

**Option** symbols This is a boolean option. Expected values are either true or false. It controls whether to load the symbol definitions.

\usepackage[symbols=true] {stmglossaries}

symbols=true is the default and loads the symbols. It is used in case symbols=false is not set explicitly.

**Option** items This is a boolean option. Expected values are either true or false. It controls whether to load the item definitions.

\usepackage[items=true] {stmglossaries}

items=true is the default and loads the styles. It is used in case items=false is not set explicitly.

**Option** styles This is a boolean option. Expected values are either true or false. It controls whether to load the style definitions.

\usepackage[styles=true]{stmglossaries}

styles=true is the default and loads the styles. It is used in case styles=false is not set explicitly.

**Option** commands This is a boolean option. Expected values are either true or false. It controls whether to load the additional command definitions.

\usepackage[commands=true]{stmglossaries}

styles=true is the default and loads the styles. It is used in case styles=false is not set explicitly.

**Option morewrites** This is a boolean option. Expected values are either true or false. It controls whether to load the morewrites package.

\usepackage[morewrites=true] {stmglossaries}

morewrites=true is the default. It is used in case morewrites=false is not set explicitly.

**Option** *makeglossaries* This is a boolean option. Expected values are either true or false. It controls whether to execute the \makeglossaries command at an appropriate location.

\usepackage[makeglossaries=true] {stmglossaries}

makeglossaries=true is the default. It is used in case makeglossaries=false is not set explicitly.

**Option** autoaddglossaryentrytoacronym This is a boolean option. Expected values are either true or false. It controls whether to invoke a call to the corresponding glossary entry in case an acronym is used.

\usepackage[autoaddglossaryentrytoacronym=false]{stmglossaries}

autoaddglossaryentrytoacronym=false is the default. It is used in case autoaddglossaryentrytoacron is not set explicitly.

**Option** *linkacronymtoglossary* This is a boolean option. Expected values are either true or false. It controls whether to add a link to the glossary entry in the list of acronyms.

\usepackage[linkacronymtoglossary=false]{stmglossaries}

linkacronymtoglossary=false is the default. It is used in case linkacronymtoglossary=true is not set explicitly.

#### 4.3. Load the acronyms package

This way, the acronyms are loaded. Load the package individually by adding

\usepackage{stmglossariesacronyms}

to your preamble.

In case you load the package individually, you have to add \makeglossaries at a convenient location in your preamble.

# 4.3.1. Options

**Option** *items* This is a boolean option. Expected values are either true or false. It controls whether to load the item definitions from stmglossariesacronymsitems.

\usepackage[items=true]{stmglossariesacronyms}

items=true is the default. It is used in case items=false is not set explicitly.

**Option** styles This is a boolean option. Expected values are either true or false. It controls whether to load the style definitions from stmglossariesacronymsstyles.

\usepackage[styles=true]{stmglossariesacronyms}

styles=true is the default. It is used in case styles=false is not set explicitly.

# 4.4. Load the glossary package

This way, the acronyms are loaded. Load the package individually by adding

\usepackage{stmglossariesglossary}

to your preamble.

In case you load the package individually, you have to add \makeglossaries at a convenient location in your preamble.

## 4.4.1. Options

**Option** items This is a boolean option. Expected values are either true or false. It controls whether to load the item definitions from stmglossariesglossaryitems.

\usepackage[items=true] {stmglossariesglossary}

items=true is the default. It is used in case items=false is not set explicitly.

**Option** styles This is a boolean option. Expected values are either true or false. It controls whether to load the style definitions from stmglossariesglossarystyles.

\usepackage[styles=true]{stmglossariesglossary}

styles=true is the default. It is used in case styles=false is not set explicitly.

#### 4.5. Load the symbols package

This way, the symbols are loaded. Load the package individually by adding

\usepackage{stmglossariessymbols}

to your preamble. In case you have not loaded *glossaries* with your own options beforehand, the package will load the package with the options acronym, nomain and toc.

In case you load the package individually, you have to add \makeglossaries at a convenient location in your preamble.

#### 4.5.1. Options

**Option** items This is a boolean option. Expected values are either true or false. It controls whether to load the item definitions from stmglossariessymbolsitems.

\usepackage[items=true] {stmglossariessymbols}

styles=true is the default. It is used in case styles=false is not set explicitly.

**Option** styles This is a boolean option. Expected values are either true or false. It controls whether to load the style definitions from stmglossariessymbolsstyles.

\usepackage[styles=true]{stmglossariessymbols}

styles=true is the default. It is used in case styles=false is not set explicitly.

**Option** commands This is a boolean option. Expected values are either true or false. It controls whether to load the command definitions from stmglossariessymbolscommands.

\usepackage[commands=true] {stmglossariessymbols}

styles=true is the default. It is used in case styles=false is not set explicitly.

# 5. Usage - in the document

## 5.1. Acronyms

Print the list of acronyms with the style stmacronymstyle and without number using nonumberlist with

\printglossary[type=\acronymtype,style=stmacronymstyle,nonumberlist]

For a description of acronym styles, see subsection 6.1.

A shortcut command using the default style is available:

#### \printstmacronyms

For the latter to work, the package stmglossariescommands must be loaded, which is the default for the stmglossaries package.

#### 5.2. Glossary

Print the glossary with the style stmglossarystyle and without number using nonumberlist with

\printglossary[type=main,style=stmglossarystyle,nonumberlist]

For a description of glossary styles, see subsection 6.2.

A shortcut command using the default style is available:

#### \printstmglossary

For the latter to work, the package stmglossariescommands must be loaded, which is the default for the stmglossaries package.

#### 5.3. Symbols

#### 5.3.1. Lists

stmglossariessymbolitems defines a number of lists for different types of symbols:

scalarlist A list for scalar values

vectorlist A list for vectors

matrixlist A list for matrices

statelist A list for peridynamic states

indexlist A list for indices

exponentlist A list for exponents

operatorlist A list for mathematical operators

#### 5.3.2. Combine lists

In case you want to combine the predefined lists and print a single combined list, e.g. for papers, use

```
\documentclass{...}
\usepackage{stmglossaries}
\newglossary[slg1]{symbollist}{syi1}{syg1}{Nomenclature}
\forallglsentries[scalarlist]{\lfoo}{\glsmoveentry{\lfoo}{symbollist}}
\forallglsentries[vectorlist]{\lfoo}{\glsmoveentry{\lfoo}{symbollist}}
\forallglsentries[matrixlist]{\lfoo}{\glsmoveentry{\lfoo}{symbollist}}
\forallglsentries[statelist]{\lfoo}{\glsmoveentry{\lfoo}{symbollist}}
\makeglossaries
\begin{document}
...
\printglossary[type=symbollist,style=YOURSTYLENAME,nonumberlist]
\end{document}
as described in section 16.1 of the glossaries documentation.
```

#### 5.3.3. Commands

**Styling** There might be a time where you very locally want to define a symbol without adding it to the global list of symbol. Despite that, you want to make sure that the symbol, e.g. for a vector, a matrix or a state, uses the correct notation style.

Therefore, stmglossariessymbolscommands defines a couple of useful styling commands

\romanscalarsymbol A roman scalar symbol
\greekscalarsymbol A greek scalar symbol
\romanvectorsymbol A roman vector symbol
\greekvectorsymbol A greek vector symbol
\romanmatrixsymbol A roman matrix symbol
\scalarstatesymbol A greek matrix symbol
\romanvectorstatesymbol A roman vector state symbol
\romandoublestatesymbol A roman double state symbol

**Utility** stmglossariessymbols commands defines a couple of useful utility commands to facilitate access to symbols and operators. These automatically add the operator symbol to the respective list.

| \csyslocal {a}                 |        | $\hat{a}$      |
|--------------------------------|--------|----------------|
| \csysmaterial {a}              |        | $\bar{a}$      |
| \difference {a}                |        | $\Delta a$     |
| \mean {a}                      |        | $\overline{a}$ |
| \norm {a}                      | 2-norm | a              |
| \transpose {a}                 |        | $a^T$          |
| \inverse {a}                   |        | $a^{-1}$       |
| \timederivativeshort {a}       |        | $\dot{a}$      |
| \timederivativeshorttwo {a}    |        | $\ddot{a}$     |
| \partialderivativeshort {a}{b} |        | $a_{,b}$       |

**Printing** There are several shortcut commands available for printing the different glossary lists using the respective default style:

```
\printstmscalarglossary
\printstmvectorglossary
\printstmmatrixglossary
\printstmstateglossary
\printstmindexglossary
\printstmexponentglossary
\printstmoperatorglossary
```

In case you want the whole thing at once, use

\printallstmsymbols

# 6. Styles

#### 6.1. Acronym styles

#### 6.1.1. stmacronymstyle

**Description** This is a style for acronyms. It has one item column which is left aligned. The columns are Abbreviation and Description. Column headings are not printed.

## 6.2. Glossary styles

#### 6.2.1. stmglossarystyle

**Description** This glossary style has two columns. The columns are *Entry* and *Description*. Both columns are left aligned.

#### 6.2.2. stmglossarysourcestyle

**Description** This glossary style has three columns. The columns are *Entry*, *Description* and Sources. The first two columns are left aligned, the last column is centered.

In case you use this style, at least the following compile sequence is necessary:

```
pdflatex
makeglossaries
pdflatex
biber
pdflatex
pdflatex
```

#### 6.2.3. stmglossarylabelsourcestyle

**Description** This glossary style has four columns. The columns are *Label*, *Entry*, *Description* and *Sources*. The first and third column are left aligned, the second and last column are centered.

In case you use this style, at least the following compile sequence is necessary:

```
pdflatex
makeglossaries
pdflatex
biber
pdflatex
pdflatex
```

#### 6.2.4. stmglossarylabelsourcestyle2

**Description** This glossary style has three columns. The columns are *Label*, *Entry* and *Sources*. The first column is left aligned, the last two column is centered. The description is printed on a separate line over all columns.

In case you use this style, at least the following compile sequence is necessary:

```
pdflatex
makeglossaries
pdflatex
biber
pdflatex
pdflatex
```

## 6.3. Symbol styles

### 6.3.1. stmsymbolstyle

**Description** This is the basic style for variables. It has one item column which is left aligned. The columns are *Symbol*, *Name* and *Description*. Column headings are printed.

#### Example

## Scalars

| Symbol | Name         | Description |
|--------|--------------|-------------|
| a      | Acceleration |             |
| m      | Mass         |             |
| F      | Force        |             |

#### 6.0.1. stmonecolpapersymbolstyle

**Description** This is a style for variables for papers with one centered item column. The columns are *Symbol* and *Name*. Column headings are not printed.

## Example

# **Scalars**

- a Acceleration
- m Mass
- F Force

## 6.0.1. stmtwocolpapersymbolstyle

**Description** This is a style for variables for papers with two centered item column. The columns are *Symbol* and *Name*. Column headings are not printed.

## Example

## **Scalars**

a Acceleration F Force

m Mass

## 6.0.1. stmindexstyle

**Description** This is a style for variable indices with one left align item column. The columns are *Symbol* and *Description*. Column headings are printed.

#### Example

 $\varepsilon_0$  (2)

# **Indices**

## Symbol Description

 $()_0$  Reference configuration

## 6.0.1. stmexponentstyle

**Description** This is a style for variable exponents with one left align item column. The columns are *Symbol* and *Description*. Column headings are printed.

# Example

$$\varepsilon^e$$
 (3)

# **Exponents**

## Symbol Description

 $()^e$  Elastic

# 6.0.1. stmoperatorstyle

**Description** This is a style for variable operators with one left align item column. The columns are *Symbol* and *Description*. Column headings are printed.

## Example

 $\nabla$  (4)

# **Operators**

## Symbol Description

 $\nabla$ ( ) Fréchet derivative

# B. All glossary entries

# Glossary

Label Entry Sources glo:allowable allowable [1] Material values that are determined from test data at the laminate or lamina level on a probability basis (e.g., A or B basis values, with 99% probability and 95% confidence, or 90% probability and 95% confidence, respectively). The amount of data required to derive these values is governed by the statistical significance (or basis) needed. API glo:API An Application Programming Interface is a particular set of rules and specifications that a software program can follow to access and make use of the services and resources provided by another particular software program that implements that API Calibration glo:calibration The process of adjusting physical modelling parameters in the computational model to improve agreement with experimental data. glo:adequacy calibration [3] The condition of satisfying all requirements for model acceptance, including those for model accuracy and for programmatic constraints such as implementation, cost, maintenance, and ease of use. glo:calculation:verification calibration [3] The process of determining the solution accuracy of a particular calculation glo:calibration:experiment calibration experiment An experiment performed to improve estimates of some parameters in the mathematical model. glo:code code [3] The computer implementation of algorithms developed to facilitate the formulation and approximate solution of a class of problems. glo:component component [1] A major section of the airframe structure (e.g., wing, body, fin, horizontal stabilizer) which can be tested as a complete unit to qualify the structure.

glo:model:conceptual

conceptual model

[3]

The process of determining that the numerical algorithms are correctly implemented in the computer code and of identifying errors in the software.

glo:coupon

coupon

[1]

A small test specimen (e.g., usually a flat laminate) for evaluation of basic lamina or laminate properties or properties of generic structural features (e.g., bonded or mechanically fastened joints).

glo:damage

damage

[1]

A structural anomaly caused by manufacturing (processing, fabrication, assembly or handling) or service usage.

glo:delamination

delamination

[1]

The separation of the layers of material in a laminate. This may be local or may cover a large area of the laminate. It may occur at any time in the cure or subsequent life of the laminate and may arise from a wide variety of causes.

glo:design:values

design values

[1]

Material, structural elements, and structural detail properties that have been determined from test data and chosen to assure a high degree of confidence in the integrity of the completed structure. These values are most often based on allowables adjusted to account for actual structural conditions, and used in analysis to compute margins-of-safety.

glo:detail

detail

[1]

A non-generic structural element of a more complex structural member (e.g., specific design configured joints, splices, stringers, stringer runouts, or major access holes).

glo:disbond

detail

[1]

An area within a bonded interface between two adherends in which an adhesion failure or separation has occurred. It may occur at any time during the life of the substructure and may arise from a wide variety of causes. Also, colloquially, an area of separation between two laminae in the finished laminate (in this case, the term "delamination" is normally preferred).

glo:digitaltwin:aiaa

digital twin

[4]

A set of virtual information constructs that mimics the structure, context and behavior of an individual / unique physical asset, or a group of physical assets, is dynamically updated with data from its physical twin throughout its life cycle and informs decisions that realize value.

glo:DTO DTO [5]

An object that carries data between processes in order to reduce the number of method calls.

glo:element element [1]

A generic element of a more complex structural member (e.g., skin, stringers, shear panels, sandwich panels, joints, or splices).

glo:environment environment [1]

External, non-accidental conditions (excluding mechanical loading), separately or in combination, that can be expected in service and which may affect the structure (e.g., temperature, moisture, UV radiation, and fuel).

glo:MPM MPM [6]

The Material Point Method is an alternative to pure Lagrangian approaches and is well suited to problems involving very large deformations. In the method, equilibrium computations take place on a background grid but the calculations are based on information (mass, volume, stress, state variables, etc.) held at material points that are convected through the background grid as the material deforms. This allows computations to take place on an undistorted background mesh (structured or unstructured) whilst modelling problems involving very large deformations. One way to summarise the material point method is: a finite element method where the integration points (material points) are allowed to move independently of the mesh.

glo:simulation Simulation [7]

The ensemble of models - deterministic, load, boundary, material, performance, and uncertainty - that are exercised to produce a simulation outcome.

glo:bonding:structural structural bonding [1]

A structural joint created by the process of adhesive bonding, comprising of one or more previously-cured composite or metal parts (referred to as adherends)

glo:bond:weak Weak bond [1]

A bond line with mechanical properties lower than expected, but without any possibility to detect that by normal NDI procedures. Such situation is mainly due to a poor chemical bonding.
