Martin Rädel

2019-12-11

This package takes care of handling cross-referencing in LaTeX documents with hypertext links. It loads the underlying base package and offers a modular collection of styles for the representation of hyperlinks. It is build upon the hyperref package.

Contents

1. Usage

1.1. Load the whole `stmhyperref` package

1.1.1. Description

This is an interface package which loads the base package and the style choice.

By default the package loads

- `stmhyperrefbase.sty`
- `stmhyperrefpdfopts.sty`
- `stmhyperrefstyles.sty`

See subsubsection 1.1.2 for options to change the default package behavior.

1.1.2. Options

Option *styles*   This is a boolean option. Expected values are either `true` or `false`. It controls whether to load the predefined styles.

`\usepackage[styles=true|false]{stmhyperref}`

   `styles=true` is the default. It is used in case `styles=false` is not set explicitly.

Option *style*   This option value is the equivalent to section 1.3.2 and is passed through to the underlying package.

Option *pdfopts*   This is a boolean option. Expected values are either `true` or `false`. It controls whether to load the predefined pdf view option sets.

`\usepackage[pdfopts=true|false]{stmhyperref}`

   `pdfopts=true` is the default. It is used in case `pdfopts=false` is not set explicitly.

Option *pdfopt*   This option value is the equivalent to section 1.4.2 and is passed through to the underlying package.

1.2. `stmhyperrefbase`

This package loads the underlying base package with some default options that can only be set during initialization.

1.3. `stmhyperrefstyles`

1.3.1. Description

This package contains styles for the optical behaviour of internal and external links. Internal links are those inside the document, e.g. references and citations. External links are those to URL's.

1.3.2. Options

Option *style*   This is a string option. A list of possible values is shown in section 2.

```
\usepackage[style=stmdefault]{stmhyperrefstyles}
```

  `style=stmdefault` is the default. It is used in case no other style is set explicitly.

1.4. `stmhyperrefpdfopts`

1.4.1. Description

This package contains definitions how to display the resulting document at opening in the viewer.

1.4.2. Options

This is a string option. A list of possible values is listed in section 3.

```
\usepackage[pdfopt=stmdefault]{stmhyperrefpdfopts}
```

  `style=stmdefault` is the default. It is used in case no other style is set explicitly. A list of possible values is shown in section 3.

2. Styles

There are different predefined styles available to format your hypertext.

2.1. `default`

This loads the default style from the underlying base package and does not apply individual styles.

2.2. `stmdefault`

This loads the color definitions for links, citations and URL's from the `stmcolor` package and applies them.

2.3. `colorlinkexternalblueinternalblack`

Please take the style information directly from appendix A.4.

2.4. `colorlinkallblack`

Please take the style information directly from appendix A.4.

2.5. `colorlinkallblue`

Please take the style information directly from appendix A.4.

3. `pdfopt` sets

There are different predefined options sets available to configure the pdf view settings.

3.1. `default`

Please take the style information directly from appendix A.3.

3.2. `stmdefault`

Please take the style information directly from appendix A.3.

3.3. `viewfitwmenuwtoolbarwobookmarksopen`

Please take the style information directly from appendix A.3.

A. The code
