Martin Rädel

2019-11-02

These are the plots definitions for `stmlatex`. It is build upon the pgfplots package.

Contents

1. Usage - in the preamble

1.1. Load the whole `stmplots` package

1.1.1. Description

This is an interface package which loads `pgfplots` and definitions commonly required throughout document creation.

By default the package loads

- `stmplotslibraries.sty`
- `stmplotsstyles.sty`

1

See subsubsection 1.1.2 for options to change the default package behavior.

1.1.2. Options

Option *compat*   This option expects a string input. Possible inputs are `pgfplots` version numbers, e.g.

`\usepackage[compat=1.14]{stmplots}`

  `compat=newest` is the default. It is used in case `libraries=$VALUE$` is not set explicitly.

Option *libraries*   This is a boolean option. Expected values are either `true` or `false`. It controls whether to load the standard libraries commonly required.

`\usepackage[libraries=true|false]{stmplots}`

  `libraries=true` is the default. It is used in case `libraries=false` is not set explicitly.

Option *styles*   This is a boolean option. Expected values are either `true` or `false`. It controls whether to load the predefined `pgfplots` styles.

`\usepackage[styles=true|false]{stmplots}`

  `styles=true` is the default. It is used in case `styles=false` is not set explicitly.

Option *externalization*   This is a boolean option. Expected values are either `true` or `false`. It enables and disables the possibilities for the externalization of `tikzpicture`s.

`\usepackage[externalization=true|false]{stmplots}`

  `externalization=true` is the default. It is used in case `externalization=false` is not set explicitly.
  See the `stmtikz` package documentation for details.

Option *externalizationoutputfolder*   This option expects a string input. Do not add a slash at the end of the string.
  With this option it is possible to define a output folder for all externalized `tikzpicture`s in case Option *externalization* has the value `true`. The folder location is set relative to the directory of the main `tex`-file.

`\usepackage[externalizationoutputfolder=$FOLDERNAME$]{stmtikz}`

  The default is `externalizationoutputfolder=ZZZ_TikZ`.

Option *globalexternalization* This is a boolean option. Expected values are either `true` or `false`.

By default externalization is not enabled for `tikzpicture`s globally, meaning automatically activated for each `tikzpicture`. It has to be activated explicitly in the document with `\tikzexternalenable`.

It is possible to control this behavior with

`\usepackage[globalexternalization=true|false]{stmplots}`

`globalexternalization=false` is the default. It is used in case `globalexternalization=true` is not set explicitly.

Global externalization is active until the next `\tikzexternaldisable` in your document.

1.2. `stmplotslibraries`

This package contains standard libraries commonly required in the creation of plots.
1.3. `stmplotsstyles`

This package contains styles commonly required in the creation of plots.

2. Test

This is a test. Code thankfully taken from
http://pgfplots.net/tikz/examples/fill-between-plots/

lalal

A. The code

A.1. stmplots.sty
